

### ABSTRACT

Performing a search to identify web sites that relate to a search term based on text within the web sites includes receiving at least one search term that then is compared with electronic information within at least one electronic information store to determine whether matches exist. The electronic information within the at least one information store may include text and/or full text displayed by different web pages from different web sites. Results based on the matches that are determined to exist are displayed. The results include at least one website identifier. The search may be performed by a web host having members and may further include automatically scanning and storing the text of a website when the website is accessed by a member of the web host. The stored text may be compared against received search terms.
